THE MERCURY MONSTER
Play with this heavy metal and you're playing with poison.
BEWARE:
Mercury can be a poisonous monster. If it spills, that silvery-slick, shiny metallic liquid found in thermometers, electrical switches, thermostats and school science labs can make you sick and contaminate anything that comes into contact with it. If it's in your house, get it out. To find out how, call your local Household Hazardous Waste facility or KDHE.
KANSAS DON'T SPOIL IT!
A public awareness initiative from the Kansas Department of Health and Environment
